DeScratch [Win/Mac] [Latest 2022]

DeScratch is an action, that removes vertical scratches from the frames of movie. The plugin is designed to remove scratches completely. There is a lot of parameters in the plugin, for maximum customization. Mainly, DeScratch has two modes: Off mode - leave scratches as they were, which means, turn of the plugin. Default mode - remove scratches, but keep image details, so it can be used for restoration of analog movie frames. If you turn Off (0), the plugin may improve the quality of your movie, but some scratches and noise will still appear. Turn On (1) can be very helpful for removing scratches in some scenes, but it removes also image details, so it may be harmful. DeScratch vs. NoDeScratch, one-shot DeScratch vs. One-shot DeScratch mode In most cases, turning DeScratch On (1) has a big negative impact. It will throw out almost all scratches, and also leave some small ones, near them. In this mode of DeScratch, there is no need to turn On (1) anymore. NoDeScratch is a one-shot mode, which can be useful, if you have original the frame, and want to turn it to the second DeScratch mode with some big negative impact (like removing all scratches). In some cases, the second mode - DeScratch, when the first mode - NoDeScratch also has negative impact, or the one-shot mode - NoDeScratch, when the other one - DeScratch. You can try to set Bypass - Mix to 0.5, and see. This will try to set right value for simple cases. DeScratch background: In NoDeScratch mode, DeScratch is turned Off. In DeScratch mode, DeScratch is turned On. Treatment of horizontal noise, if the noise lines are not vertical If some horizontal noise lines appear in the image, the plugin tries to remove them, for example - if all vertical lines are vertical scratches, then it can be used for horizontal noise, if all vertical lines are horizontal scratches, then it can be used for horizontal noise, if some vertical and horizontal lines can be treated, then it is used for the case. Default parameters are as follows: Bypass - Mix: all scratched frames to 100% Bypass - Mix (line 1): 100% Bypass - Mix 09e8f5149f

DeScratch is a plugin for removing vertical scratches, noises and drops from analog film. The plugin uses spatial information only from current frame, but after some thresholds is applied to each pixel. For removing scratches (which are vertical lines) plugin applies vertical blur and local extremum searching. After vertical blur there is a variation in luma values (every pixel image signal). There are two classes of lines: smooth (blurred lines) or scratches or details (sharp vertical lines). A non-smooth or details lines can be of a noise or dropout. Smooth (without scratches) vertical lines are removed with help of a median filter. There is a choice of a size of lines in each frame that is smoothed, which allows the user to remove some very thin lines or remove some strong vertical noise. Afterwards, small extremum (extreme value with a positive or negative direction) are selected, and these are used to expand the extremum position and to define initial position for the horizontal component of scratch. After adding new horizontal edges, the shape of the scratch is full shaped. The plugin has an option to get at the same time linear part and a point part. Linear part is mapped to a median filter, so the result is linear, while the shape of the scratch is completed. If instead linear is selected, only the linear part is added. To give to the user the possibility to adjust the amount of detail lost, there is a choice in percentage of detail to keep. In the same way are removed horizontal or vertical noises or scratches. The plugin also includes the possibility to adapt the shape of noise to get it more smooth. Compatibility and use The plugin works with any video format (MPEG-4) and with any resolution (up to the maximum standard). This plugin is written for video editing software such as Vegas, Adobe Premiere, etc. The plugin has the possibility to remove lines both horizontally and vertically (which can be used in combination with each other). Exemple 1: Use "four vertical scratch" (with one scratch in all frames) in combination with "remove horizontal noises" (in only one frame) with image rotation, after image rotation the plugin able to remove scratches vertically and horizontally, there is a possibility to rotate horizontally and get scratch edges without rotation. Exemple 2: Use "scratch" (horizontal) and "four vertical scratch" in all frames (hor

What's New In?

Plugin is built from scratch. But main idea are extracts most used algorithms from Quicktime Decode plugin. I use in plugin both plugins for vertical and horizontal edge detection. DeScratch Screenshot DeScratch works just fine if image is edited during the process. This way it allows user to keep original image and add specified percent of detail to original image. This information can be used for de-scratch, de-dirt or de-aging. DeScratch plugin can be used with every image, but it is much more effective if it works on non-edited original image. DeScratch Scratch Mode Scratch detection in this mode is not as effective as in On Edit Mode. But if there are enough changes in horizontal level on a frame, then detection of scratches may be successful. In this case, a scratch will appear as a vertical edge. A scratch has some definite width. It is helpful to make three iterations, perform a filtering in this region and then subtract it to the original. In the first iteration, skin, fur or whatever skin detail may be cut. It is enough for left skin line. In the second iteration, it can cut all horizontal and vertical lines in the region. In the third iteration, it is enough to leave only skin details. But then a bigger area in the skin region is painted, which is desired. In the scratch mode, it is better to do not first apply a vertical blur, instead a horizontal blur. Horizontal blur isn't as effective as vertical one, but horizontal lines in a vertical image and vice versa are more rarely seen. So a horizontal blur does more often work and less rarely miss. DeScratch Offset Horizontal artifacts usually have luma variation in every horizontal row. DeScratch plug-in uses it for horizontal edge detection. DeScratch Offset is the difference in luma between middle and extreme pixels in a frame. DeScratch Offset Screenshot This difference must be compared with some minimum value, so the difference between extreme points may be replaced by median or mean values of other points. This may be set by user for de-scratch. DeScratch Offset Settings De-scratch Offset Settings DeScratch Version 0.1 Bug Reports Bug reports are welcome! Thank you. DeScratch History DeScratch was built during a few day. This plugin was my first plugin. I was looking
