Editing Adobe Photoshop CS6 enables the creation and correction of several types of image flaws. These include flaws in exposure, color, and contrast, as well as correcting JPEG artifacts and deghosting. **Figure 1-2** The Photomerge command. When

an image is composed of several different images, Photoshop CS6 can create an Action layer that will automatically create a clone layer for each image in the composite image. _Cloning_ means creating a new layer on top of the original image and duplicating it to add extra objects in the composite. _Cloning_ is one way to simulate a

composite shot that may have been taken with a camera tripod and an array of lights. When using an Action layer, only the selected areas in the composite image are cloned, not the entire composite. All images in the composite are edited. _Once_ you edit one area of the composite, you _must_ edit the rest of the composite, otherwise

you'll have to create an Action layer again. Each Action layer can be assigned a blending mode, which determines the background color of the cloned or composite image. Additionally, you can select the blending mode for other areas in the Action layer, such as the background of the composite. For example, if you don't like the color

in one area of the composite, you can select that area, turn off the Action layer, change the blending mode to Screen, and apply a new
