Use Photoshop with caution. It can be tough to master a computer program. Keep backups of your images. Matching Up Light and Dark Images One of the most common mistakes that beginning Photoshop users make is to simply use Auto Levels when they use the Auto Tone function. Auto Levels converts any image that is too dark or too light to reflect the difference in

levels. In Figure 10-7, only the black point was selected. Because the point is close to black and white, Auto Levels should apply the black point equally to both sides of the contrast gradient. The result in Figure 10-7 shows that the background white paper has been clipped so that it is completely invisible and that the dark shadow portion of the figure has been changed to a gray. The Auto Levels function worked better than Auto Tone but looks quite odd. Photoshop's image-altering features enable you to control the contrast in your image much better than Auto Levels. In the figure, the point is set to Select Color and the Mapping drop-

down menu is set to Shadows. The shadows are then set to no mapping, so Auto Levels will use the dark point to lighten the shadow area. If it used highlight instead of shadows, the light part of the figure's face would be completely pure white instead of being more grayscale. **Figure 10-7:** The Auto Levels feature sometimes does a poor job of matching levels. You may be tempted to say "I don't want to mess with this image, I just want to straighten it out!" But the point of Auto Levels is to make your image look like it was meant to be messed with. That's why it is recommended that you use Auto Levels to save time when straightening

up an image. If you are a beginning Photoshop user, you should take the time to get to know how the program works. Be sure to read and use the Help system — it does make it much easier to use. If you need additional help, watch a video tutorial or browse the web for a better understanding. If you just want to use the image-altering tools in Photoshop to duplicate parts of an image (as in the edges in Figure 10-8), you can use the Duplicate tool or the Move tool to do so. Photoshop has a lot of cool features, but you still must get to know the program and learn how to use it. A big part of doing that is to use

The differences between Photoshop and Adobe Photoshop Elements come from their different aims and intended uses. Photoshop is more a complete graphics editor and features much more fine control. Photoshop Elements is a more simple solution for non-photographers, but still has advanced features. This means you may often be switching between the two software tools. Basic Editing The basic editing features of Photoshop Elements are the same as those in regular Photoshop. You can edit or resize photos, create new images and even create images

from scratch in both vector and raster formats. There are three tools available to edit files in Photoshop Elements: Crop. Adjust Curves. Adjust Levels. With Crop, you can crop images that have been imported, taken or created in Elements. You can also auto-crop images to a specific aspect ratio. The Adjust Curves tool in Photoshop Elements is used to adjust the contrast, brightness and colour of images. You can apply different curves to different ranges, or use the auto-curve function to do the job. Adjust Levels lets you adjust the overall exposure of images, and you can set the brightness of specific areas. You can crop and edit

images in many ways. There is an auto-crop function for simple crops, but you can also rotate and distort your photo to fit into different shapes. You can also adjust the size of your photo to specific proportions. And because Elements is designed for non-photographers, there are many common photo editing features such as adjustment layers and filters. Live Browsing The next step of the editing process is viewing your images. You can view your image in full-screen, full-size, or at a fractional resolution. When you are viewing your file in full-screen, you can see a histogram to indicate the image's exposure. Unlike regular Photoshop,

Elements has a basic image viewer, which looks similar to the regular Photoshop image viewer. You can add and remove layers from photos, as well as take snapshots or save an image as a PDF or JPEG. With the image viewer, you can view your photos in both standard and slideshow settings. The slideshow function in Elements is limited to your photos in layers, but you can still add markers to your photos. You can also view your images in thumbnail view, a smaller view that lets you see multiple images on a single screen. You can zoom into your photos using a zoom 05a79cecff

At least seven people were killed and dozens more wounded in clashes in the Yemeni capital between Shiite Houthi rebels and army units loyal to the country's former president, Saleh, according to local and international news organizations. The violence broke out at an area close to Houthi and army buildings in Sanaa, the capital city of Yemen. Government troops backed by airstrikes apparently decided to carry out airstrikes on the Houthis, killing at least seven. "Regional security sources said seven people, including three children, were killed when a military

unit loyal to Saleh hit an apartment building belonging to the Houthi movement," the Associated Press reported. The Houthis, who are believed to be Shiite Muslims from neighboring Iran, have been fighting against the predominately Sunni country's government led by the internationally recognized president, Abd Rabbuh Mansur Hadi. Many local news organizations cited the head of the army, Gen. Mohsen al-Bakri, as saying that the security forces have been fighting against the Houthis, and that the airstrikes were carried out in an attempt to stop them. The Houthis have in the past month captured a number of

towns and cities across Yemen. According to the group, its fighters have also carried out a number of attacks on oil facilities and ports along the Red Sea, in an attempt to control the oil infrastructure of the country. "The Hadi government has acknowledged that the Houthi rebels have taken over the northwest part of the country and have vowed to fight them," Reuters reported. "Clashes have intensified between the two sides in several areas including Sanaa." The Houthis, who also control the capital Sanaa, have demanded that Hadi step down, and have been calling for an uprising against the government. So far

Hadi and the government are standing firm, saying that they will only step down when their demands are met. One of the Houthi's main demands is for a parliamentary election to be held. The Houthis accused the country's ruling party of fixing the elections in their favor. The Houthis' claim is based on the fact that the government has allegedly confiscated weapons from people in the north, while the government-backed people are not allowed to carry weapons in their protests. The violence comes a day after Amnesty International called for the release of about 60 prisoners of conscience, who were originally

arrested by the Houthis last summer.

$${\rm u}_n=A_n r^n+B_n r^{-n}$$ with constants A_n, B_n. Now the second equation can be integrated from $r=R$ to the boundary $r=1$ with respect to the variable r. It will be $$\begin{split} \phi_n''-\left(\frac{n(n+1)}{r^2}-2n+\frac{2}{r}+\frac{2p_n}{r^2}-\lambda_n\right)\phi_n'+p_n\phi_n=0. \end{split}$$ The unique non-trivial solution of this equation is $$\begin{split} \phi_n&=\sqrt{r}[A_n r^{-n-1}+B_n r^{n+1}]\sum_{l=0}^{\infty}(-1)^l\frac{a_l(n)}{r^{l+1}(2n+1)}. \end{split}$$ In a similar way the general solution of the equation ${\rm d}\phi_n/{\rm d}r=0$
