Windows .Q: How do I create a QT application which acts like a window manager? I'm writing a game and would like the application to respond to inputs from the user (basically other windows, but not through direct window management). I have looked at examples of QT such as this, and this, but I am still trying to grasp how QT works. I want to be able to write a small program which I can use to open and close my program, and another QT window which I can interact with (playing a sound, changing an image, etc). Any advice/help would be greatly appreciated, it looks like this is what I need, but I don't know how it works. A: The "QT-Application with another window" tutorial looks like a good starting point. In short, you have an interactive widget (main window) called MyWindow. MainWindow is a QMainWindow and MyWindow is a QWidget. That way you can add a QImage (or any other widget) to MyWindow. The main window has a signal called createMyWindow which is connected to the Q\_OBJECT macro. This macro lets you connect to signals and slots. Your createMyWindow slot can do whatever you want, using any variables you want in your code. For the second window, you want to use a QSplitter. A QSplitter is a widget that has a QWidget in each side c6a93da74d
