now that you know how the watch-dogs keygen functions, you are ready to use it to automate the deployment of containers. you can use the watch-dogs keygen for your own deployments, or you can use it to test the functionality of the keygen by running the watch-dogs script in the following example. for clusters running on platforms that are not machine api enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (csrs). if a request is not approved, then the oc exec, oc rsh, and oc logs commands cannot succeed, because a serving certificate is required when the api server connects to the kubelet. any operation that contacts the kubelet endpoint requires this certificate approval to be in place. the method must watch for new csrs, confirm that the csr was submitted by the node-bootstrapper service account in the system:node or system:admin groups, and confirm the identity of the node. openshift container platform and kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. note that on many cloud platforms, storage size and iops scale together, so you might need to over-allocate storage volume to obtain sufficient performance. this configuration does not enable serial console access on machines with a graphical console. to configure a different console, add one or more console= arguments to the kernel line. for example, add console=tty0 console=ttyS0 to set the first pc serial port as the primary console and the graphical console as a secondary console. for more information, see how does one set up a serial terminal and/or console in red hat enterprise linux.

### Watch Dogs Keygen V1-2 Form

now that you know how the watch-dogs keygen functions, you are ready to use it to automate the deployment of containers. you can use the watch-dogs keygen for your own deployments, or you can use it to test the functionality of the keygen by running the watch-dogs script in the following example. for clusters running on platforms that are not machine api enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (csrs). if a request is not approved, then the oc exec, oc rsh, and oc logs commands cannot succeed, because a serving certificate is required when the api server connects to the kubelet. any operation that contacts the kubelet endpoint requires this certificate approval to be in place. the method must watch for new csrs, confirm that the csr was submitted by the node-bootstrapper service account in the system:node or system:admin groups, and confirm the identity of the node. openshift container platform and kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. note that on many cloud platforms, storage size and iops scale together, so you might need to over-allocate storage volume to obtain sufficient performance. this configuration does not enable serial console access on machines with a graphical console. to configure a different console, add one or more console= arguments to the kernel line. for example, add console=tty0 console=ttyS0 to set the first pc serial port as the primary console and the graphical console as a secondary console. for more information, see how does one set up a serial terminal and/or console in red hat enterprise linux. 5ec8ef588b
